ABSTRACT OF THE DISCLOSURE

A damper apparatus for controlling airflow between compartments in a two
compartment refrigerator having a door includes a controller for controlling opening
and closing of a damper; and a door sensor connected to the controller for detecting
when the door is open. If the controller determines that the door has remained closed
for a set period, the controller maintains the damper in the closed position. A method
for cleaning a damper in a refrigerator includes a steps of defrosting a refrigeration
apparatus of the refrigerator, at least partially opening the damper, followed by
waiting for a set period and then at least partially closing the damper. The steps of at
least partially opening and waiting are repeated a set number of times and then a
cooling operation of the refrigeration apparatus is commenced.
